KAIROS
an IQVIA business

FROM CUTTING-EDGE RESEARCH – TAILOR-MADE FOR GENERAL AND SPECIALIST HOSPITALS.
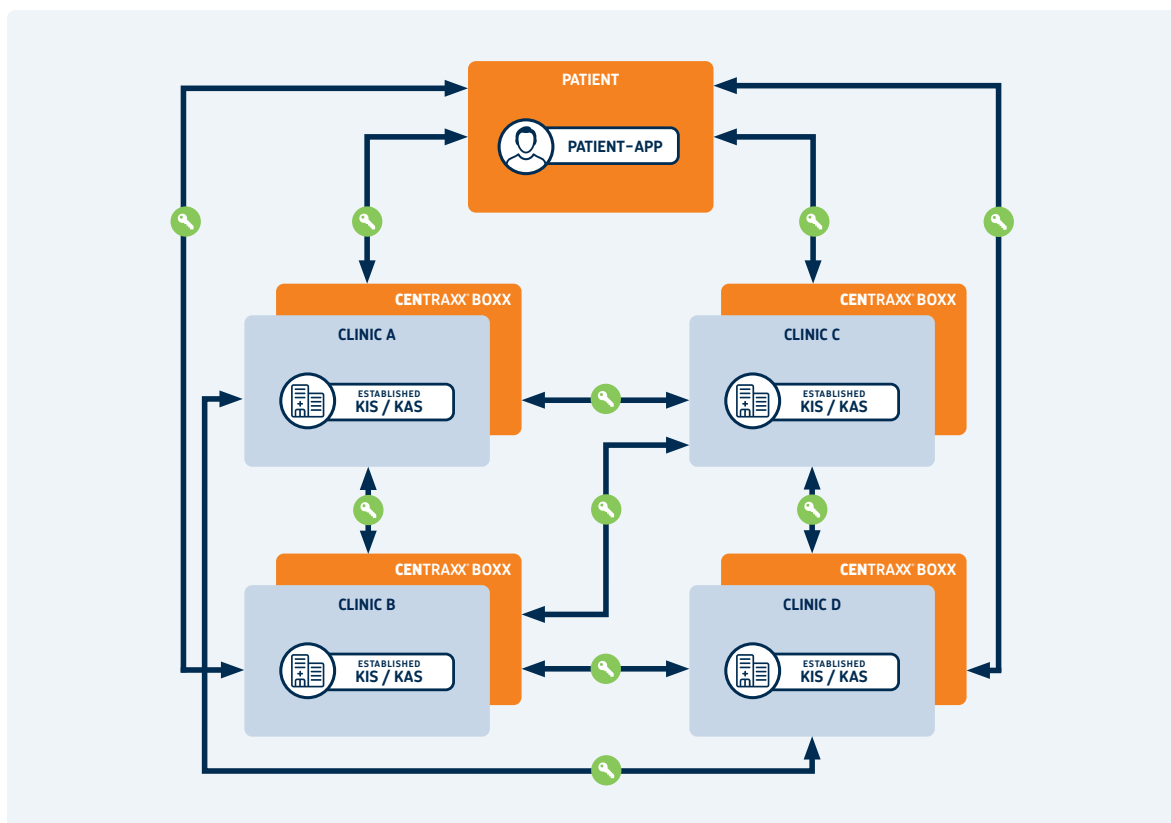

CENTRAXX® BoXX

NOW IS THE TIME. Research institutes and biotech companies can expand their existing IT architecture of HIS and CWS (Clinical Workplace System) with little effort, enabling them to search and discover research-relevant information on patients using IT. This is made possible by the compact KAIROS product solution „CentraXX BoXX".

CentraXX BoXX is the result of many years of development experience and user case evaluation of the CentraXX product family in top medical research. Hospitals implementing CentraXX BoXX can access all structured contents of an HL7 message and perform their own targeted searches within the stored HL7 information. One mouse click is all it takes to find out which patients have or have had which diseases, diagnoses, procedures or laboratory results. With the CentraXX Report Engine, users in hospitals can create patient-related statistics at any time and communicate the data prepared in this way according to their needs.

In addition to consolidating patient information and displaying the entire patient record, the CentraXX BoXX can also be used to compare information with other patients. This record of information can be supplemented by the attachment of freely created individual forms or important files related to the patient.

Structured data can be transferred to CentraXX via XML, as can special documentation after appropriate transformation. Such documentation can include information that has been recorded in Excel tables or in in-house developed software programs that are difficult to maintain. In conjunction with the CentraXX patient app, the CentraXX BoXX supports the clinic in transmitting personal data directly to the respective patient.

In the hospital itself, this can also be done using terminal systems. The functionalities of the CentraXX BoXX are precisely tailored to the requirements of medical treatment. Clinics benefit from this today both functionally and financially, from the experience gained over many years of development work on the CentraXX product family and the growing structural spread of the system.

Supported by a user-friendly installation program, the CentraXX BoXX can be installed independently or via remote maintenance, e.g. on systems provided by the clinic. The CentraXX BoXX consists of an HL7 listener, a CentraXX Clinical Data Warehouse, a research file, a comprehensive XML interface and a report engine (based on BIRT). The CentraXX

BoXX is compatible with all CentraXX basic and system solutions. CentraXX is becoming increasingly widespread in Germany and has recently come to North America with installations in both the United States and Canada.
Currently in Germany, the system is used by 30 university hospitals, 3 German Centers for Health Research, the Helmholtz Association, and the NAKO Health Study.

From a technical point of view, it is possible to network individual locations or system networks, which simplifies participation in large consortium projects and is often the infrastructure that makes them possible in the first place.

Would you like to find out more about the CentraXX BoXX? Or are you already a CentraXX user and would like to integrate this module into your existing CentraXX architecture?
